Lens epithelial cell ongrowth: comparison of 6 types of hydrophilic intraocular lens models.

Uveal and capsular biocompatibility of a single-piece, sharp-edged hydrophilic acrylic intraocular lens with collagen (Collamer): 1-year results.

Influence of operator experience on the performance of ultrasound biometry compared to optical biometry before cataract surgery.

Ocular surface changes and tear film alterations associated with sun gazing during a solar eclipse.
Nepp J, Dorner GT, Jandrasits K, Maar N, Schild G, Wedrich A.

Is acupuncture an useful tool for pain-treatment in ophthalmology?
Acupunct Electrother Res. 2002;27(3-4):171-82.

Uveal and capsular biocompatibility of 2 foldable acrylic intraocular lenses in patients with uveitis or pseudoexfoliation syndrome: comparison to a control group.

Inflammation after implantation of hydrophilic acrylic, hydrophobic acrylic, or silicone intraocular lenses in eyes with cataract and uveitis: comparison to a control group.
Abela-Formanek C, Amon M, Schauersberger J, Kolodjaschna J, Barisani-Asenbaum T, Kruger A.

Results of hydrophilic acrylic, hydrophobic acrylic, and silicone intraocular lenses in uveitic eyes with cataract: comparison to a control group.
Abela-Formanek C, Amon M, Schauersberger J, Kruger A, Nepp J, Schild G.

Effect of heparin in the irrigation solution on postoperative inflammation and cellular reaction on the intraocular lens surface.

Uveal and capsular biocompatibility of hydrophilic acrylic, hydrophobic acrylic, and silicone intraocular lenses.

Uveal and capsular biocompatibility of 2 foldable acrylic intraocular lenses in patients with uveitis or pseudoexfoliation syndrome: comparison to a control group.
Department of Ophthalmology, University of Vienna, Medical School, Vienna, Austria.
